

ESP8266 NodeMCU — ESP8266-01

3V3 -> VCC && Chip Enable

GND -> GND

TX -> TX

RX -> RX

That's all basic connection.

Except for this, we have **GPIO2 floating but connected with a pull-up resistor** in ESP01.

GPIO0 is connected with a pull-up resistor in ESP01. GPIO0 **HIGH** means it's *working*, and **LOW** means it entered *boot (programming)* mode.

Reset Pin needs to connect **LOW** when it needs to reset; otherwise, it's also **connected with a pull-up resistor** in ESP01.
